

Static Analysis - DVIA-v2-swift.ipa

FILE INFORMATION

File Name:b DVIA-v2-swift.ipa

Size: 19.37MB

MD5: 35469622303ba10a2195557a3ad1810a

SHA1: 85174824d6cd7c83df98c518247acf8a14b28882

SHA256: a0efb217f3dd018a4fbea7b2d63db7da4e21d5d7cdc20bd4a72a8a5b57e98817

APP INFORMATION

App Name: DVIA-v2

Identifier: com.hightitudehacks.DVIAswiftv2

Version: 1

SDK Name: iphoneos11.2

Platform Version: 11.2

Min OS Version: 10.0

PERMISSIONS

Permissions	Description	Reason in Manifest
NSCameraUsageDescription	Access the Camera. To demonstrate the misuse of Camera, please grant it permission once.	

App Transport Security (ATS)

ISSUE	STATUS	DESCRIPTION
Exception in NSAppTransportSecurity flag is Found	Insecure	App Transport Security (ATS) is disabled on the domain '{'NSAllowsArbitraryLoads': True}'. Disabling ATS can allow insecure communication with particular servers or allow insecure loads for web views or for media, while maintaining ATS protections elsewhere in your app.

BINARY ANALYSIS

ISSUE	STATUS	DESCRIPTION
fPIE -pie flag is Found	Secure	App is compiled with Position Independent Executable (PIE) flag. This enables Address Space Layout Randomization (ASLR), a memory protection mechanism for exploit mitigation.
fstack-protector-all flag is Found	Secure	App is compiled with Stack Smashing Protector (SSP) flag and is having protection against Stack Overflows/Stack Smashing Attacks.
fobjc-arc flag is Found	Secure	App is compiled with Automatic Reference Counting (ARC) flag. ARC is a compiler feature that provides automatic memory management of Objective-C objects and is an exploit mitigation mechanism against memory corruption vulnerabilities.
Binary make use of banned API(s)	Insecure	The binary may contain the following banned API(s) _strncpy, _alloca, _printf, _memcpy, _fopen, _strncpy, _strlen, _strcat, _sprintf, _gets

ISSUE	STATUS	DESCRIPTION
Binary make use of the following Crypto API(s)	Info	The binary may use the following crypto API(s) SecTrustSetAnchorCertificates, CCMacGetOutputLength, SecIdentityCopyCertificate, CCCryptorFinal, SecTrustGetCertificateAtIndex, SecCertificateCopySubjectSummary, SecCertificateCopyData, SecTrustCopyExceptions, CCMacRelease, CCMacUpdate, SecCertificateGetTypeID, CCMacCreate, SecCertificateCreateWithData, CCMacDerivationPBKDF, SecTrustEvaluate, SecKeyGeneratePair, SecTrustSetExceptions, SecTrustGetCertificateCount, SecKeyRawSign.
Binary make use of the following Weak HASH API(s)	Insecure	The binary may use the following weak hash API(s) CC_SHA1_Update, CC_MD5_Final, CC_SHA1_Init, CC_SHA1, CC_MD5_Init, CC_SHA1_Final, CC_MD5_Update, CC_MD5
Binary make use of the following HASH API(s)	Info	The binary may use the following hash API(s) CC_SHA256_Init, CC_SHA256_Final, CC_SHA256, CC_SHA256_Update.
Binary make use of the insecure Random Function(s)	Insecure	The binary may use the following insecure Random Function(s) _random.
Binary make use of Logging Function	Info	The binary may use NSLog function for logging.
Binary make use of malloc Function	Insecure	The binary may use malloc function instead of calloc .

'The architecture surrounding mappings is designed to move from one longLivedReadTransaction to another. This allows you to freeze the data-source (databaseConnection) of your UI on a particular commit. And then atomically move the data-source from an older commit to a newer commit in response to YapDatabaseModifiedNotifications. This ensures that the data-source for your UI remains in a steady state at all times, and that updates are properly handled using the appropriate update mechanisms (and properly animated if desired). For example code, please see the wiki: <https://github.com/yapstudios/YapDatabase/wiki/Views>'

When you initialize the database, the snapshot (uint64) is set to zero. Every read-write transaction (that makes modifications) increments the snapshot. Now, when you ask the viewConnection for a changeset, you need to pass matching mappings & notifications.

That is, the mappings need to represent the database at snapshot X, and the notifications need to represent the database at snapshots @[X+1, X+2, ...]. This does not appear to be the case. This most often happens when the databaseConnection isn't using a longLivedReadTransaction. And this happens by accident most often when you use a databaseConnection, which is in a longLivedReadTransaction, to perform a read-write transaction. Doing so implicitly forces the connection out of the longLivedReadTransaction, and moves it to the most recent snapshot. If this is the case, be sure to use a separate connection for your read-write transaction.'
